FD-C Series

Circular Single Blade Externally Resettable Combination Fire and Volume Control Damper

- ES classified fire dampers with reduced smoke leakage characteristics (BS EN 1366-2)
- Aerodynamically Air Control tested to BS EN 1751
- Tested and assessed installation methods in differing supporting constructions (BS EN 1366-2)
- Integrated volume control capability
- Replaceable fusible link from outside of the ductwork
- Commissioning friendly
- External blade position indicator
- Damper casing conforms to BS EN 1506
The FD-C Series

The FD-C Manual Operation Single Blade Fire Damper with volume control facility has been designed specifically for installations where space is at a premium and installation within the fire separation is not feasible. The testing and resetting of the damper and thermal fuse external of the duct allows for ease of commissioning and maintenance. NB: Access panels may be required to comply with DW145 G.3.1.5.

The installation plate, with its engineered installation perforations, acts as a template to allow the marking of the fixing positions on the surface structure to which the plate will be affixed, allowing for a quick and efficient install.

Introduction

What is a fire damper and why might they be needed?
The FD-C Series Single Blade Circular Fire Damper is designed to stop the spread of fire through ducts, walls, floors and ceilings.

The product range has many features and options to meet the requirements of specifiers, contractors, local and national authorities. Dampers are available to suit both low/medium and high velocity applications.

What are the ‘E’ and ‘ES’ classifications?

To achieve the classifications to EN13501-3, fire dampers and fire and smoke dampers shall be tested to EN1366-2 and a 300Pa pressure difference is applied across the damper. During the fire test period, the integrity of the seal between the damper and the structure shall not have any gaps larger than 150mm x 6mm. There shall not be any sustained flaming. The largest size of damper to be manufactured for sale as a single section shall be fire tested.

$E = \text{Integrity}$
The maximum leakage permissible at 300Pa corrected to 20°C is $360\,m^3/hr/m^2$ (100 l/s/m$^2$) throughout the fire test period.

$ES = \text{Integrity with Smoke Leakage Performance}$
The maximum leakage permissible at 300Pa corrected to 20°C is $200\,m^3/hr/m^2$ (55.5 l/s/m$^2$) at ambient prior to the fire test and throughout the fire test period. In addition, for the ES classification to be attained, the smallest damper must also meet the $200\,m^3/hr/m^2$ maximum leakage with a 300Pa pressure across the damper. (This is equivalent to just 0.55 l/s on a 100x100 damper)

Fire dampers should be installed as tested.

Some applications (fan off) allow the use of tests undertaken to BS 476-20/22 and this is also allowed worldwide in areas outside of the EU. Test reports showing testing to EN 1366-2 should be acceptable to meet the requirements of BS 476-20/22, but the reverse is definitely not the case and no classifications are available.

However, as a word of caution, in whichever case, the correct model must be selected, to match fire resistance time with installation method and with the supporting construction (wall or floor).

To ensure that all testing and assessments are traceable back to initial fire test reports, the BSB FD-C series is product certificated by the Loss Prevention Certification Board (LPCB). This means that in addition to normal BS EN ISO 9001 compliance, the product is also checked to ensure that same product is being manufactured that has been tested or assessed.

BSB have a policy of continued testing and product certification to try and provide as broad a number of installation methods as possible.

BSB also follow regulation and standards development very carefully to provide input on changes and to be able to pass on relevant information to designers, specifiers, building control authorities (BCA’s) and installers.

The FD-C Series Range

The BSB FD-C series is available in the following case diameters:

- FD-C100 - 100mm diameter
- FD-C125 - 125mm diameter
- FD-C150 - 150mm diameter
- FD-C160 - 160mm diameter
- FD-C200 - 200mm diameter
- FD-C250 - 250mm diameter
- FD-C300 - 300mm diameter
- FD-C315 - 315mm diameter

Testing and Conformities

Tested to EN1366-2
See installation details (Pages 6-11) for full details.

Tested/assessed and achieved equivalent classification to:

- ES Classification (BS EN 1366-2/BS EN 13501-3)
  - BSB FD-C fitted with Installation Plate
    - E180 - Blockwork/Masonry wall
    - ES120 - Blockwork/Masonry wall
    - E90 - Dry Partition wall
    - ES90 - Dry Partition wall

FD-C Blade leakage
(BS EN 1751)
- Class 2

FD-C Features and Benefits

- Tested and certified installation variants of the FD-C are available for both blockwork and stud partitions.
- All BSB tested installation methods give at least an E90 classification.

Volume Control Application
The FD-C manual damper has the facility for volume control utilising the seven presets at 10° set points from fully open to 30° from the fully closed position.

The operating handle has been designed to be in line with the blade orientation thus providing an accurate guide to the blade set or released position.

The FD-C manual damper continues to be a fully operational fire damper at these presets, and when released closed manually or through the melting of the thermal fuse meets the test criteria of EN 1366-2 as provided in the relevant test reports.

Blade Seal (patent pending)
Layered glass woven sheets and central intumescent disc to a patented design that allows the blade assembly to be of minimal thickness, thus minimising pressure loss, providing an effective seal to comply with EN 1366-2 achieving ES classification.

Blade
Galvanised 1.2mm one piece circular steel discs either side of the patented seal design providing a 5mm thick assembly affixed by blade brackets to the reset handle. Grade 430 stainless steel option available.

Typical Tender/Specification Text

The BSB FD-C combination Fire and Volume Control Damper shall pass the test requirements stated in EN 1366-2.

For maintenance of the integrity of compartmentation the fire damper shall have an E classification to EN 13501-3.

The damper shall have an ES classification complying with EN1366-2 and EN 13501-3 and have a minimum E90 and ES90 rating.

Damper casings shall conform to BS EN 1506.

For the protection of escape routes and areas with sleeping risk, the FSD-C fire/smoke damper should be used. Please refer Approved Document B (ADB).

The single blade layered design shall be held open against a constant force spring that is released via a fusible link having an alloy component that melts at 72°C allowing the spring mechanism to close the damper.

The damper assembly and fusible link shall be safely tested and released closed externally to the damper without the need for specialist tools or access panels. NB: Access panels may be required to comply with DW145 G.3.1.5.

The fire damper body shall be fully welded to meet the air tightness test requirements of HVCA specification DW144 to class A B & C to a maximum of 1000Pa and comply with EN1751.

The closed blade shall meet the air tightness test requirement of BS EN 1751 Class 2.

The BSB FD-C combination fire and volume control damper shall have a tested or assessed installation method that matches the requirement of the supporting construction. DW145 Method 4 Blockwork Walls and Partition Walls refers.

Leakage Classification

Blade leakage classification is given numerically and case leakage classification is given using capital letters.

- Class 4, 3, 2 or 1 refers to blade leakage – EN1751 section C.2 refers.
- Class 4 achieving the lowest leakage.
- Class A, B or C refers to casing leakage - EN1751 section C.3 refers.
- DW144 part 8 table 17 and figure 178 refers.
- Class C achieving the lowest leakage at elevated pressures.

The above references are illustrated in the graphs on Pages 6, 7 and 9 of this brochure.

Cleats

Cleats are factory fitted as pairs to the damper installation plate on the same face as the control side, allowing the damper to be supported via drop roads. It is recommended that the installation plate is additional utilised in the installation of the damper to ensure that the damper does not move in a fire condition.

See Below for Drop Rod details.

Drop Rod Studding Minimum Recommended Dia.

Minimum loads are taken from the ASFP Blue Book and refers to unprotected steel studding, generally up to 1.5m long.

The figures shown must be read in conjunction with the ASFP Blue Book.

FD-C Series
Single Blade Circular Fire Dampers – Product Testing

Tested to BS EN 1366-2 - Test Report No. 276065 refers

- Fire and Volume Control dual function.
- Tested to BS EN 1366-2 and BS EN 13501-3.
- E180 integrity classification.
- ES120 integrity classification.

- Complies with classes A, B & C of DW144.
- Surpasses minimum requirements on case leakage.
- Surpasses minimum requirements on blade leakage.

Test Conclusions:

The FD-C damper satisfied the requirements of BS EN 1366-2 and BS EN 13501-3 achieving the lowest closed blade leakage of any damper within its class. Dampers were tested affixed to the inside of the furnace wall and also to the external wall of the furnace with the damper closed blade being fully exposed to the furnace rapid rising temperature. The achieved ES classification ensures that in a fire condition the non fire side is fully protected (from radiated heat) for the achieved period, providing vital time for the emergency services to respond, ensuring safe passage of escape and protection of contents.

The FD-C damper satisfied the requirements of BS EN 1366-2 and BS EN 13501-3 achieving the lowest closed blade leakage of any damper within its class. Dampers were tested affixed to the inside of the furnace wall and also to the external wall of the furnace with the damper closed blade being fully exposed to the furnace rapid rising temperature. The achieved ES classification ensures that in a fire condition the non fire side is fully protected (from radiated heat) for the achieved period, providing vital time for the emergency services to respond, ensuring safe passage of escape and protection of contents.

The FD-C single blade combination fire and volume control damper with its unique feature of requiring only a single installation plate when being installed within tested applications, and without the need for any infill between the damper body and the structure that it sits within. Is the first damper of its type to achieve and exceed the requirements of classification EN1366-2.

Micro Switch

The factory fitted micro switch to provide remote indication of the damper blade status. The micro switch is fitted on the opposite side to the operating handle where a purpose designed cam fitted to the protruding blade operating spindle allows the release of the micro switch actuating lever, allowing the snap action contacts 1NO + 1NC to change state.

Wiring connections are made via M3, 5 terminal screw fixings.

Mechanical life: 1 million cycles

Complies with EN60204 and EN292 standards

Maintenance Notes

FD-C Series dampers are designed for normal dry filtered air systems.

A programme of planned inspections should be carried out to include full operational checks, correct interface with, and function of, any control systems, cleaning and light lubrication.

As a guide, this should take place on a maximum of six month intervals.

Reference should be made to BS 5588-12 and BS 9999 for more information.

Records of damper installation and position shall be kept. Records of the condition of the dampers and their functionality/repair etc should be kept as these products come under the requirements of the Regulatory Reform (Fire safety) Order (RRFSO).

These inspection and maintenance programmes may need to be repeated more regularly if the dampers are exposed to inclement/dusty conditions or fresh air intakes and the frequency of such checks should be developed based on site experience.
